

cppEDM Version 0.0.1 March 1, 2019

cppEDM is a C++ implementation of empirical dynamic modeling (EDM) algorithms. It is designed as an application programming interface (API) with functions stored in the libEDM.a library.

Introduction

cppEDM is a C++ implementation of empirical dynamic modeling (EDM) algorithms. Core algorithms are listed in table 1. It is primarily a functional programming implementation with application programming interface (API) functions accepting parameters and returning data objects. EDM functions are accessed from a user-compiled library created from C++ source files and a unix-like compiler supporting the C++11 standard. cppEDM shares many high-level design attributes with the pyEDM package.

Algorithm	API Interface	Reference
Simplex projection	<code>Simplex()</code>	Sugihara and May (1990)
Sequential Locally Weighted Global Linear Maps (S-map)	<code>SMap()</code>	Sugihara (1994)
Predictions from multivariate embeddings	<code>Simplex()</code> , <code>SMap()</code>	Dixon et. al. (1999)
Convergent cross mapping	<code>CCM()</code>	Sugihara et. al. (2012)
Multiview embedding * Not yet implemented		Ye and Sugihara (2016)

Convenience functions to prepare and evaluate data are listed in table 2.

Function	Purpose	Parameter Range
<code>Embed()</code>	Timeseries delay dimensional embedding	User defined
<code>EmbedDimension()</code>	Evaluate prediction skill vs. embedding dimension	$E = [1, 10]$
<code>PredictInterval()</code>	Evaluate prediction skill vs. forecast interval	$T_p = [1, 10]$
<code>PredictNonlinear()</code>	Evaluate prediction skill vs. SMap nonlinear localisation	$\theta = 0.01, 0.1, 0.3, 0.5, 0.75, 1, 1.5, 2, 3, 4, 5, 6, 7, 8, 9$
<code>ComputeError()</code>	Pearson correlation, MAE, RMSE	

Installation

cppEDM is available at github.com/SugiharaLab/cppEDM.

The libEDM.a library can be built by running "make" in the cppEDM/src/ directory. This copies libEDM.a into the cppEDM/lib/ directory, where it can be linked to user applications.

cppEDM requires a C++11 standard compiler, and the Eigen C++ template library (eigen.tuxfamily.org/).

Once libEDM.a is built, there are a series of test applications in the cppEDM/tests/ directory. The applications can be built with the "make" command, and then executed at the command line.

Class Objects

Two C++ class objects are used for data access and parameter coordination, the **DataFrame** and **Parameters** classes, described below.

DataFrame

The **DataFrame** class is the fundamental data object of cppEDM. It stores data in a contiguous block of memory using the C++ **valarray** type in a row-major format.

A **DataFrame** can be initialised with data from a csv file by calling the **DataFrame** constructor with **path** and **fileName** parameters. The **WriteData(path, file)** class method can be called explicitly to write data to a csv format file.

All data input files are assumed to be in csv format. The files are assumed to have a single line header with column names, and it is required that the first column be a vector of times or time indices.

Primary **DataFrame** access functions are listed in table 3.

DataFrame Method	Parameters	Type	Purpose
(row, column)	size_t row size_t column	double or int	Access data element
DataFrame(path, file)	string path string fileName	DataFrame<double>	Create DataFrame from csv file
WriteData(path, file)	string outputFilePath string outputFileName		Write DataFrame to file
Elements()		valarray	Access data valarray
NColumns()		size_t	Get number of columns
NRows()		size_t	Get number of rows
size()		size_t	Get number of elements
ColumnNames()		vector< string >	Access column names
ColumnNameToIndex()		map<string, size_t>	Access column name to index map
MaxRowPrint()		size_t	Access maximum number of rows to ostream
Column(col)	size_t col	valarray	Get data vector at column
Row(row)	size_t row	valarray	Get data vector at row
VectorColumnName(column)	string column	valarray	Get data vector at column with name
DataFrameFromColumnIndex (columns)	vector<size_t> columns	DataFrame<double>	Get DataFrame subset from column indices
DataFrameFromColumnNames (columns)	vector<string> columns	DataFrame<double>	Get DataFrame subset from column names
WriteRow(row, array)	size_t row std::valarray<T> array		Write valarray to row
WriteColumn(col, array)	size_t col valarray<T> array		Write valarray to column

Parameters

The `Parameters` class is used to store and access API function parameters in a unified object. Generally this is an internal object that does not need to be instantiated, accessed or dynamically modified. API parameter names and purpose are listed in table 4.

Parameter	Type	Default	Purpose
pathIn	string	"./"	Input data file path
dataFile	string	""	Data file name
pathOut	string	"./"	Output file path
predictFile	string	""	Prediction output file
lib	string	""	library start : stop row indices
pred	string	""	prediction start : stop row indices
E	int	0	Data dimension
TP	int	0	Prediction interval
knn	int	0	Number nearest neighbors
tau	int	1	Embedding delay
theta	float	0	SMap localisation
columns	string	""	Column names or indices for prediction
target	string	""	Target library column name or index
embedded	bool	false	Is data an embedding?
verbose	bool	false	Echo messages
smapFile	string	""	SMap coefficient output file
libSizes_str	string	""	CCM library sizes
sample	int	0	CCM number of random samples
random	bool	true	CCM use random samples?
seed	unsigned	0	RNG seed, 0 = random seed

Application Programming Interface (API)

Embed

Create a data block of Takens time-delay embedding from each of the columns in the csv file or dataFrame. The columns parameter can be a list of column names, or a list of column indices. If columns is a list of indices, then column names are created as V1, V2...

Note: The returned DataFrame will have $\tau \cdot (E - 1)$ fewer rows than the input data from the removal of partial vectors as a result of the embedding.

Note: The returned DataFrame will not have the time column.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame< double > Embed ( std::string path      = "",  
                           std::string dataFile = "",  
                           int             E      = 0,  
                           int             tau     = 0,  
                           std::string columns = "",  
                           bool            verbose = false );  
  
//-----  
// Overload 2: DataFrame provided  
//-----  
DataFrame< double > Embed ( DataFrame< double > dataFrame,  
                           int             E      = 0,  
                           int             tau     = 0,  
                           std::string columns = "",  
                           bool            verbose = false );  
  
//-----  
//-----  
DataFrame< double > MakeBlock ( DataFrame< double > dataFrame,  
                               int             E,  
                               int             tau,  
                               std::vector<std::string> columnNames,  
                               bool            verbose );
```

Simplex

Simplex projection of the input data file or DataFrame. The returned DataFrame has 3 columns "Time", "Observations", "Predictions". nan values are inserted where there is no observation or prediction. See the Parameters table for parameter definitions.

lib and pred specify row indices of the input data for the library and predictions.

If embedded is false the data columns are embedded to dimension E with delay tau. If embedded is true the data columns are assumed to be a multivariable data block.

If knn is not specified, it is set equal to E+1.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame<double> Simplex( std::string pathIn      = "./data/",  
                           std::string dataFile    = "",  
                           std::string pathOut     = "./",  
                           std::string predictFile  = "",  
                           std::string lib         = "1 10",  
                           std::string pred        = "11 20",  
                           int E                 = 0,  
                           int Tp                = 1,  
                           int knn               = 0,  
                           int tau               = 1,  
                           std::string columns     = "",  
                           std::string target     = "",  
                           bool embedded         = false,  
                           bool verbose          = true );  
  
//-----  
// Overload 2: DataFrame provided  
//-----  
DataFrame<double> Simplex( DataFrame< double >,  
                           std::string pathOut     = "./",  
                           std::string predictFile  = "",  
                           std::string lib         = "1 10",  
                           std::string pred        = "11 20",  
                           int E                 = 0,  
                           int Tp                = 1,  
                           int knn               = 0,  
                           int tau               = 1,  
                           std::string columns     = "",  
                           std::string target     = "",  
                           bool embedded         = false,  
                           bool verbose          = true );
```

SMap

SMap projection of the input data file or DataFrame. See the Parameters table for parameter definitions.

SMap() returns a SMapValues structure:

```
struct SMapValues {
    DataFrame< double > predictions;
    DataFrame< double > coefficients;
};
```

The predictions DataFrame has 3 columns "Time", "Observations", "Predictions". nan values are inserted where there is no observation or prediction. If predictFile is provided the predictions will be written to it in csv format.

The coefficients DataFrame will have E+2 columns. The first column is the "Time" vector, the remaining E+1 columns are the SMap SVD fit coefficients.

lib and pred specify row indices of the input data for the library and predictions.

If embedded is false the data columns are embedded to dimension E with delay tau. If embedded is true the data columns are assumed to be a multivariable data block. If smapFile is provided the coefficients will be written to it in csv format.

If knn is not specified, it is set equal to the library size. If knn is specified, it must be greater than E.

```
//-----
// Overload 1: Explicit data file path/name
//-----
SMapValues SMap( std::string pathIn      = "./data/",
                 std::string dataFile    = "",
                 std::string pathOut     = "./",
                 std::string predictFile = "",
                 std::string lib         = "1 10",
                 std::string pred        = "11 20",
                 int          E           = 0,
                 int          Tp          = 1,
                 int          knn         = 0,
                 int          tau         = 1,
                 double       theta       = 0,
                 std::string  columns     = "",
                 std::string  target      = "",
                 std::string  smapFile    = "",
                 std::string  jacobians   = "", // Not implemented
                 bool         embedded    = false,
                 bool         verbose     = true );
```

```

//-----
// Overload 2: DataFrame provided
//-----
SMapValues SMap( DataFrame< double >,
    std::string pathOut      = "./",
    std::string predictFile  = "",
    std::string lib          = "1 10",
    std::string pred         = "11 20",
    int          E           = 0,
    int          Tp          = 1,
    int          knn         = 0,
    int          tau         = 1,
    double       theta       = 0,
    std::string  columns     = "",
    std::string  target      = "",
    std::string  smapFile    = "",
    std::string  jacobians   = "", // Not implemented
    bool         embedded    = false,
    bool         verbose     = true );

```

CCM

Convergent cross mapping via Simplex of the first element in columns against target. See the Parameters table for parameter definitions.

The returned DataFrame has 3 columns. The first column is "LibSize", the second and third columns are Pearson correlation coefficients for "column : target" and "target : column" cross mapping.

libSizes specifies a string with "start stop increment" row values, i.e. "10 80 10" will evaluate library sizes from 10 to 80 in increments of 10.

If random is true, N sample are randomly selected from the subset of each library size. If seed=0, then a random seed is generated for the random number generator. Otherwise, seed is used to initialise the random number generator.

If random is false, sample are ignored and the contiguous library rows up to the current library size are used.

Note: Cross mappings are performed between column : target, and target : column. The default is to do this in separate threads. Threading can be disabled in the makefile by removing -DCCM_THREADED.

Note: The entire library size is used in the Simplex prediction at each library subset size.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame<double> CCM( std::string pathIn      = "./data/",  
                      std::string dataFile   = "",  
                      std::string pathOut    = "./",  
                      std::string predictFile = "",  
                      int      E             = 0,  
                      int      Tp            = 0,  
                      int      knn           = 0,  
                      int      tau           = 1,  
                      std::string columns    = "",  
                      std::string target     = "",  
                      std::string libSizes   = "",  
                      int      sample        = 0,  
                      bool      random       = true,  
                      unsigned  seed         = 0,      // seed=0: use RNG  
                      bool      embedded     = false,  
                      bool      verbose      = true );
```

```

//-----
// Overload 2: DataFrame provided
//-----
DataFrame<double> CCM( DataFrame< double >,
    std::string pathOut      = "./",
    std::string predictFile  = "",
    int         E            = 0,
    int         Tp           = 0,
    int         knn          = 0,
    int         tau          = 1,
    std::string columns      = "",
    std::string target       = "",
    std::string libSizes     = "",
    int         sample       = 0,
    bool        random       = true,
    unsigned    seed         = 0,    // seed=0: use RNG
    bool        embedded     = false,
    bool        verbose      = true );

```

EmbedDimension

Evaluate Simplex prediction skill for embedding dimensions from 1 to 10. The returned DataFrame has columns "E" and "rho". See the Parameters table for parameter definitions.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame<double> EmbedDimension( std::string pathIn      = "./data/",  
                                  std::string dataFile    = "",  
                                  std::string pathOut     = "./",  
                                  std::string predictFile  = "",  
                                  std::string lib         = "1 10",  
                                  std::string pred        = "11 20",  
                                  int Tp                 = 1,  
                                  int tau                = 1,  
                                  std::string columns     = "",  
                                  std::string target      = "",  
                                  bool embedded          = false,  
                                  bool verbose           = true );
```

```
//-----  
// Overload 2: DataFrame provided  
//-----  
DataFrame<double> EmbedDimension( DataFrame< double >,  
                                  std::string pathOut    = "./",  
                                  std::string predictFile = "",  
                                  std::string lib        = "1 10",  
                                  std::string pred       = "11 20",  
                                  int Tp                 = 1,  
                                  int tau                = 1,  
                                  std::string columns     = "",  
                                  std::string target      = "",  
                                  bool embedded          = false,  
                                  bool verbose           = true );
```

PredictInterval

Evaluate Simplex prediction skill for forecast intervals from 1 to 10. The returned DataFrame has columns "Tp" and "rho". See the Parameters table for parameter definitions.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame<double> PredictInterval( std::string pathIn      = "./data/",  
                                   std::string dataFile    = "",  
                                   std::string pathOut     = "./",  
                                   std::string predictFile  = "",  
                                   std::string lib         = "1 10",  
                                   std::string pred        = "11 20",  
                                   int E                  = 0,  
                                   int tau                = 1,  
                                   std::string columns     = "",  
                                   std::string target      = "",  
                                   bool embedded          = false,  
                                   bool verbose           = true );
```

```
//-----  
// Overload 2: DataFrame provided  
//-----  
DataFrame<double> PredictInterval( DataFrame< double >,  
                                   std::string pathOut    = "./",  
                                   std::string predictFile = "",  
                                   std::string lib        = "1 10",  
                                   std::string pred       = "11 20",  
                                   int E                  = 0,  
                                   int tau                = 1,  
                                   std::string columns     = "",  
                                   std::string target      = "",  
                                   bool embedded          = false,  
                                   bool verbose           = true );
```

PredictNonlinear

Evaluate SMap prediction skill for localisation parameter θ from 0.01 to 9. The returned DataFrame has columns "theta" and "rho". See the Parameters table for parameter definitions.

```
//-----  
// Overload 1: Explicit data file path/name  
//-----  
DataFrame<double> PredictNonlinear( std::string pathIn      = "./data/",  
                                     std::string dataFile   = "",  
                                     std::string pathOut     = "./",  
                                     std::string predictFile = "",  
                                     std::string lib         = "1 10",  
                                     std::string pred        = "11 20",  
                                     int E                  = 0,  
                                     int Tp                 = 1,  
                                     int tau                 = 1,  
                                     std::string columns     = "",  
                                     std::string target      = "",  
                                     bool embedded           = false,  
                                     bool verbose            = true );
```

```
//-----  
// Overload 2: DataFrame provided  
//-----  
DataFrame<double> PredictNonlinear( DataFrame< double >,  
                                     std::string pathOut     = "./",  
                                     std::string predictFile = "",  
                                     std::string lib         = "1 10",  
                                     std::string pred        = "11 20",  
                                     int E                  = 0,  
                                     int Tp                 = 1,  
                                     int tau                 = 1,  
                                     std::string columns     = "",  
                                     std::string target      = "",  
                                     bool embedded           = false,  
                                     bool verbose            = true );
```

ComputeError

Compute Pearson correlation coefficient, maximum absolute error (MAE) and root mean square error (RMSE) between two vectors.

ComputeError() returns a VectorError struct:

```
struct VectorError {  
    double rho;  
    double RMSE;  
    double MAE;  
};  
  
//-----  
//-----  
VectorError ComputeError( std::valarray< double > obsIn,  
                           std::valarray< double > predIn );
```

Application Notes

All data input files are assumed to be in csv format. The files are assumed to have a single line header with column names, and it is required that the first column be a vector of times or time indices.

`SMap ()` should be called with a DataFrame that have columns explicitly corresponding to dimensions E . This means that if a multivariate data set is used, it should Not be called with an embedding from `Embed ()` since `Embed ()` will add lagged coordinates for each variable. These extra columns will then not correspond to the intended dimensions in the matrix inversion and prediction reconstruction. In this case, use the `embedded` parameter set to `true` so that the columns selected correspond to the proper dimension.

Example Application

```
// g++ Test.cc -o Test -std=c++11 -g -I../src -L../lib -lstdc++ -lEDM

#include "Common.h"
//-----
//-----
int main( int argc, char *argv[] ) {

    try {
        //-----
        // embedded = false : Simplex embeds data file columns to E
        //-----
        DataFrame<double> dataFrame =
            Simplex( "../data/", "block_3sp.csv",
                    "./", "Block3sp_E3.csv",
                    "1 100", "101 195", 3, 1, 0, 1,
                    "x_t y_t z_t", "x_t", false, true );

        dataFrame.MaxRowPrint() = 12; // Set number of rows to print
        std::cout << dataFrame;

        VectorError ve = ComputeError(
            dataFrame.VectorColumnName( "Observations" ),
            dataFrame.VectorColumnName( "Predictions" ) );

        std::cout << "rho " << ve.rho << " RMSE " << ve.RMSE
                    << " MAE " << ve.MAE << std::endl << std::endl;

    }

    catch ( const std::exception& e ) {
        std::cout << "Exception caught in main:\n";
        std::cout << e.what() << std::endl;
        return -1;
    }
    catch (...) {
        std::cout << "Unknown exception caught in main.\n";
        return -1;
    }

    std::cout << "Normal termination.\n";

    return 0;
}
```

Code Notes

1) The OSX XCode compiler/linker seems to be incompatible with the C++11 standard implementation allowing template classes to be distributed into declarations (.h) and implementation (.cc). To support OSX, DataFrame.h contains both declarations and implementations. See: etc/libstdc++_Notes.txt.

2) The code relies heavily on class and data containers without explicit heap allocation. This facilitates garbage collection. However, using copy-on-return for large data objects is likely a performance issue. If the code encounters massive data objects/large problems, this may pose a significant limitation.

3) Eigen template library. The recommended SVD solver is the BDCSVD that scales to large problems. The Eigen documentation states:

This algorithm is unlikely to provide accurate results when compiled with unsafe math optimizations. For instance, this concerns Intel's compiler (ICC), which performs such optimization by default unless you compile with the -fp-model precise option. Likewise, the -ffast-math option of GCC or clang will significantly degrade accuracy.

See: https://eigen.tuxfamily.org/dox/group__TutorialLinearAlgebra.html

However, when running the SMap circle.csv test, this solver (with default parameters) produces occasional divergence. We have therefore defaulted to the JacobiSVD solver.

4) Eigen template library. Eigen allows replacement of its internal template library routines with direct calls to BLAS/LAPACK libraries. See: <https://eigen.tuxfamily.org/dox/TopicUsingBlasLapack.html> This may offer performance and stability advantages.
